Elle ’n’ Elle Gym Centre

Project Handoff Summary

1. Project Overview

Elle ’n’ Elle Gym Centre is a React + Tailwind CSS website project for a fitness centre in Akobo, Ibadan, Oyo State, Nigeria. The project is being developed as a professional, responsive gym website with clear navigation, service and membership information, booking, contact information, Google Maps access, and a consistent black/green visual identity.

2. Current Technology Stack

Technology	Current use
React	Frontend application and reusable components
Vite	Development/build tooling
Tailwind CSS	Styling and responsive UI
React Router	Client-side page routing
JavaScript	Application logic and interactivity
Paystack Inline JS	Test/demo payment flow for bookings

3. Project Structure / Main Areas

• **Home / Landing Page:** Main hero, gym introduction, About section, services overview, training experience, how it works, why choose us, member feedback marquee, location/map, and final CTA.

• **Services & Membership:** Combined page containing services, membership plans, pricing, getting-started information, and booking CTAs.

• **Booking:** Booking form with date selection, service/plan selection, pricing, and Paystack test/demo payment flow.

• **Contact:** Contact details, enquiry form, gym image, Google Maps embed, and Google Maps link.

• **Navbar:** Responsive desktop/mobile navigation with Home, Services & Membership, Booking, Contact, and Join Now.

• **Footer:** Logo, quick links, contact information, opening hours, booking CTA, and Google Maps links.

4. Confirmed Business Information

Item	Current value
Business	Elle ’n’ Elle Gym Centre
Location	Akobo, Ibadan, Oyo State, Nigeria
Daily membership	₦3,500
Weekly membership	₦17,000
Monthly membership	₦30,000
Family package	₦30,000

Personal training	■5,000

5. Design & UX Requirements

• Use a black/dark background with white text and green accents.

• Keep the interface professional, modern, responsive, and mobile-friendly.

• Use the gym's real images and logo throughout the website.

• Keep images clear and sharp; avoid stretching or unnecessary distortion. CSS cannot restore missing source resolution.

• The feedback section should move continuously from right to left without stopping.

• Opening/navigating to a new page should scroll the user to the top.

• The footer should appear consistently across pages.

• The gym location should be accessible through Google Maps from the footer and relevant contact/location sections.

• The mobile navigation should direct users to the current page structure: Home, Services & Membership, Booking, and Contact.

6. Important Assets / Paths

```
• /images/gym-training.png — gym/training image
• /images/gym-team.png — gym/team image
• /images/group-training.png — group/personal training image
• /images/workout-poster.png — workout poster image
• /images/logo.jfif — navbar logo path used in the current Navbar code
```

7. Google Maps

The project uses both an embedded Google Maps iframe and a direct Google Maps search link for Elle 'n' Elle Fitness, Arts & I.T Centre. These are used on the Home/Contact location areas and footer.

```
Search URL: https://www.google.com/maps/search/?api=1&query;=Elle%27n%27Elle%20Fitness%2C%20Arts%20%26%20I.T%20Centre
```

8. Current Navigation / Routes

Route	Purpose
/	Home / landing page
/about	About route exists in the current routing, although the intended design is to keep About content inside Home rather tha
/services	Services & Membership
/booking	Booking
/contact	Contact

9. Current Contact Page

The current Contact.jsx is a complete Contact page. It includes contact details, Google Maps access, an enquiry form with controlled React state, a success message, a gym/team image, an embedded map, and a final call-to-action section.

Important current limitation: the contact form currently displays a local success message and clears the form; it is not yet connected to a real email service or persistent database.

10. Current Landing-Page Status

The landing page is the current priority. The user explicitly wants to finish and polish the landing page before moving into backend/database work. The current Home/App structure already contains the main hero, About content, service cards, training experience, process/how-it-works content, why-choose-us content, member feedback marquee, location/map section, and final CTA.

Next immediate development step: continue from the current App.jsx/Home landing-page code and integrate or refine the required landing-page sections, including the contact experience, rather than moving to Supabase or other backend work.

11. Backend / Integrations — Later Stage

• Paystack test/demo payment flow is already being developed for booking payments.

• The backend currently has a health endpoint and can receive booking data, but permanent storage is not yet the focus.

• Supabase has been created/planned for booking storage with fields such as full name, email, phone, service, date, time, message, amount, payment reference, and created timestamp.

• A Resend email confirmation integration was considered for website email confirmations, but it should remain a later-stage task.

• Do not move to backend/Supabase until the landing page is finished and the user explicitly asks to continue.

12. Known Technical Details

• React Router is used for navigation.

• A ScrollToTop component uses useLocation() and window.scrollTo() whenever pathname changes.

• The CSS contains a marquee keyframe animation and .animate-marquee class for continuous feedback movement.

• The application uses a dark visual system with Tailwind utility classes.

• The Navbar is responsive and uses local state to open/close the mobile menu.

• The Footer contains navigation, contact information, opening hours, logo, booking CTA, and Google Maps links.

13. Handoff Rules for Continuing the Project

• Do not restart the project from scratch.

• Do not replace working components unnecessarily.

• Work from the existing React + Vite + Tailwind structure.

• Ask for or use the current App.jsx/Home.jsx when landing-page changes depend on its exact current code.

• Preserve the user's existing images, pricing, branding, and navigation unless a change is explicitly requested.

• Keep the landing page as the immediate priority.

• Do not start Supabase/backend integration unless explicitly requested after the landing page is complete.

Handoff status: Frontend development is active. The main site structure and core pages are established. The immediate goal is to finish the landing page and polish the user experience before proceeding to backend/database integrations.
